Semi-Annual Update Report on Large-Load Customer Additions in Advanis ced Stages of Development – Fall 2025

Duke Energy Carolinas, LLC ("DEC") and Duke Energy Progress, LLC ("DEP" and together with DEC, "the Companies") are filing this semi-annual large load addition report (the "Fall 2025 Report") with North Carolina Utilities Commission ("Commission") pursuant to the Commission's *Order Accepting Stipulation, Granting Partial Waiver of Commission Rule R8-60A(d)(4), and Providing Further Direction for Future Planning*, Docket No. E-100, Sub 190 (Nov. 1, 2024) (the "2024 CPIRP Order"). Specifically, Ordering Paragraph No. 7 directed the Companies to "monitor continued economic development and the pipeline of large load additions (at or greater than 20 MW), including wholesale load, in their service territories and . . . file semiannual reports with the Commission addressing changes to proposed large load additions in the advanced stage of development."[1] This Report provides the second semi-annual Report filed pursuant to Ordering Paragraph No. 7. The first semi-annual Report was filed on May 15, 2025 ("Spring 2025 Report").

Background

The Companies first developed and incorporated an economic development adjustment into their Spring 2023 Load Forecast (which was used to develop the 2023 Carbon Plan and Integrated Resource Plan ("CPIRP")) and Fall 2023 Load Forecast (which was used to develop the 2024 Supplemental Planning Analysis ("SPA")). In its 2024 CPIRP Order, the Commission acknowledged that the Companies' service territories in North Carolina and South Carolina "are experiencing significant economic development activity [that] materially impacts Duke's load forecast."[2] In light of such a significant impact, the Commission found that the Companies' method for developing their load forecast, including the use of the Economic Development Adjustment, was reasonable for planning purposes and directed the Companies to file semiannual reports providing detail on economic development activity and large load customer growth in its service areas.[3] As presented in their recently filed 2025 CPIRP in this docket, the Companies are continuing to apply an economic development adjustment to their load forecast to ensure that they capture the full expected impact of large load-related economic development in the Carolinas as part of their resource plan.

The Companies' economic development adjustment to the load forecast recognizes that only a fraction of their overall economic development pipeline will ultimately materialize. Therefore, the load forecasting process is designed to account for the most mature and committed projects classified as "Advanced Development" while also recognizing, based on the Companies' recent experience, that a portion of the additional

[1] The 2023 CPIRP Order further directed the Companies to file their first large load addition report on or before April 15, 2025, and the Commission subsequently granted the Companies a 30-day extension to the reporting requirement.

[2] 2023 CPIRP Order at 66.

[3] *Id.* ("The Commission concludes that Duke's method for developing its load forecast, including its use of the economic development adjustment, was reasonable for planning purposes in this proceeding[.]").

large economic development projects earlier in the pipeline are likely to advance to become Advanced Development Projects.

Advanced Development Projects are defined as projects that have sufficiently advanced plans such that their demand can be anticipated with a high degree of certainty. To be considered an Advanced Development Project, potential customers must generally have:

(1) Executed an Electric Service Agreement ("ESA") detailing the service to be provided;

(2) Executed a Letter Agreement ("LA") formalizing the location, size, and nature of the load and the load ramp timing and committing the potential customer to reimburse the Companies for money spent designing or constructing facilities on behalf of the customer; or

(3) Progressed to advanced stage discussions in advance of signing an LA or ESA (the "Late-Stage Pipeline").[4]

In the 2023 Spring Load Forecast, the Companies initially identified eight (8) Advanced Development Projects with an annual "full load" peak demand[5] of approximately 1,350 MW for incorporation into the 2023 Spring Load Forecast which was used as an input into the 2023 CPIRP. In preparing the 2023 Fall Load Forecast (used for the 2024 SPA), the Companies identified an additional 27 projects that had made sufficient commitments to qualify as Advanced Development Projects for inclusion in the Fall 2023 Load Forecast. Thus, a total of 35 Advanced Development Projects—collectively 3,833 MW of full load peak demand requirements by 2034—were included in the 2024 SPA.

As reported in the Spring 2025 Report, the Companies identified a total of 35 Advanced Development Projects for inclusion in the Spring 2025 Load Forecast economic development adjustment—collectively 5,914 MW of peak demand requirements (at full load) by the tenth year of the forecast. The Spring 2025 Load Forecast is the forecast used for the 2025 CPIRP.

Fall 2025 Update

This Fall 2025 Report provides the Commission with the Companies' current information on Advanced Development Projects as of October, 2025. While the number and cumulative size of Advanced Development Projects have remained roughly the same as what was reported in the Spring 2025 Report, the portfolio of Advanced Development

Projects continues to show projects advancing through the pipeline from Late Stage to LA and ESA. The table below shows the Advanced Development Projects by category:

Table 1: Status of Advanced Development Projects (at full load)

	SPA Filing		Spring 2025 Economic Development Update		Fall 2025 Economic Development Update	
	# Projects	2033 MW's (10 years)	# Projects	2034 MW's (10 years)	# Projects	2034 MW's (10 years)
Electric Service Agreement	5	285	9	540	14	2,502
Letter Agreement	20	2,180	22	4,669	20	2,686
Late Stage Pipeline	10	1,368	4	705	4	422
Total	**35**	**3,833**	**35**	**5,914**	**38**	**5,610**

Table 2 below presents a summary of change in the economic development forecast (at full load) over time from the 2023 Fall Load Forecast used in the SPA, to the current October or Fall 2025 Update.

Table 2: 10-Year Advanced Development Forecasts (at full load)

Forecast	# Projects	MW by Year 10[6]
SPA Filing (Jan 2024)	35	3,833
Spring 2025 Economic Development Update	35	5,914
Fall 2025 Economic Development Update	38	5,610

Figure 1 below shows the change in the annual peak demand of Advanced Development Projects (at full load) over time from the 2023 Fall Load Forecast, to the current Fall 2025 Update.[7] Year one represents the incremental economic development full load peak demand in the first year of the forecast. Due to the passage of time, year one of

[6] "MW by Year 10" reflects the total full load non-discounted number of MW from Advanced Development Projects expected to be online and taking electricity by year ten (10) of a given forecast period.

[7] The Mid-Stage Pipeline is an additional category of projects that is generally comprised of projects at earlier stages of negotiations, but which have shown significant interest within the Companies' territory, including through participating in site visits and engaging in initial Letter Agreement negotiations. The Advancing Development Scenario to the Companies' 2025 Spring Load Forecast includes an additional 2,000 MW by 2040 (approximately 40% of the Mid-Stage Pipeline) recognizing that a subset of the Mid-Stage Pipeline Projects are likely to progress to become Advanced Development projects.

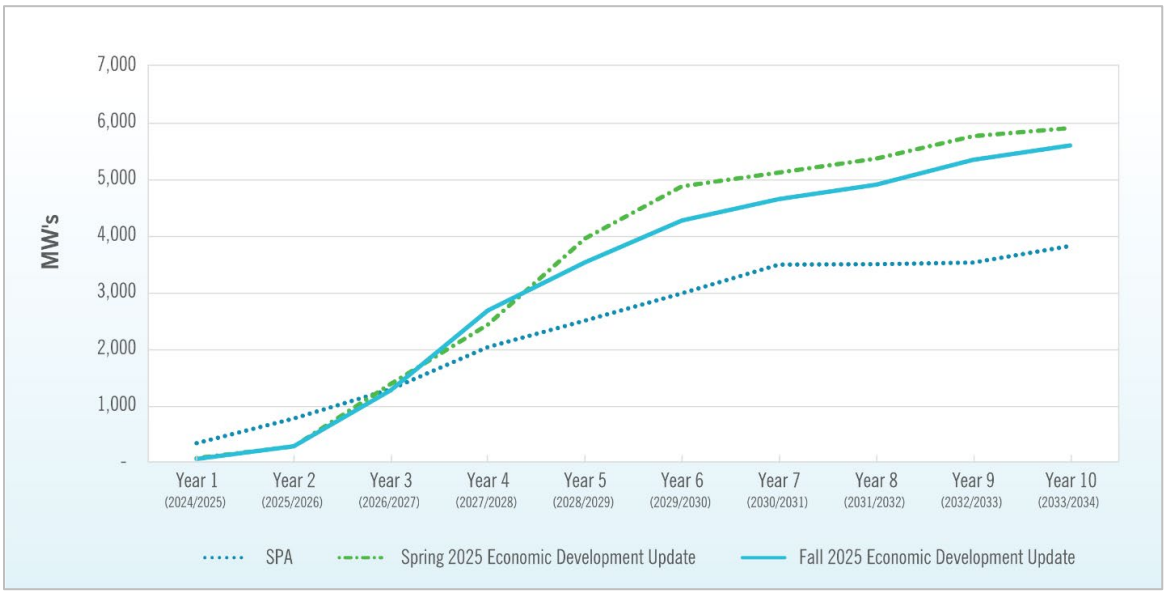
the current Spring 2025 and Fall 2025 updates begins in 2025, whereas the SPA began in 2024.

Figure 1: Carolinas Retail Advanced Development Projects Over Time (at full load)



In addition to the foregoing projections of large load customers additions to be served at retail by the Companies in their North Carolina and South Carolina service territories, the Companies also plan for potential large load customer additions served by electric cooperative or municipal utility customers who purchase power at wholesale from DEC or DEP. In order to plan for and include wholesale large load customer requirements in the forecast, the Companies work directly with the wholesale customers that are served by DEC and DEP. These wholesale customer forecasts are subject to many of the same economic trends included in the retail forecast including likely economic development additions. Currently, the Companies' wholesale forecast includes two (2) discrete projects that ramp up over the planning period, and total nearly 900 MW by 2035. The Companies will continue to engage with wholesale customers to identify potential new large load customers that are progressing towards advanced stages of development.
